# Combinatorial Puzzle Designs

by Michael D. Dowle

(2017)

## Preface/Background

The vintage (late 1960s/early 1970s) “Beat the Computer” Pla-Puzzle No. 0 was the only puzzle published by Tenyo, Japan, with rounded puzzle pieces. This puzzle triggered my interest and an idea for a new puzzle design, and subsequently groups of puzzles. I purchased the Pla-Puzzle No. 0 in the early 1970s. I was, however, disappointed and frustrated by the puzzle design, since two of the thirteen pieces were identical. Each puzzle piece was a circle with up to six protuberances around the circumference, but there was no circular piece without any protuberances. Instead there were two circular pieces with one protuberance.

Replacing one of the duplicate pieces with a circle created a complete geometric set comprising thirteen different puzzle pieces. This set satisfyingly filled a template with three-fold circular symmetry.

## Combinatorial Puzzle Designs

The Combinatorial Puzzles presented here require a set of 13 puzzle pieces to be fitted inside a template. The objective is to find 13 solutions. Each solution must have a different puzzle piece covering the center of the template (except for Puzzle 8). There may be alternate solutions for each puzzle piece.

The pieces for each puzzle are generated using the same principle and constitute a geometric set. A set of puzzle pieces is produced by arranging up to six shapes in every possible configuration around a differently shaped central piece that exhibits six-fold rotational symmetry. The templates possess three-fold rotational symmetry. These properties can be seen in the following illustrations.

Three groups of Combinatorial Puzzles are described – each group has its own design characteristics, but all groups share the same common objective.

Each Combinatorial Puzzle is presented on a page in a common format, *viz.* puzzle pieces (on left); design grid structure and puzzle template (on right); puzzle solutions (bottom).

The designs of the puzzle pieces and corresponding templates are different for the three groups presented. For the first group (Puzzles 1 through 8), 12 of the 13 pieces have mirror symmetry (five of which also have rotational symmetry) while the 13th piece is chiral. The templates possess both three-fold rotational symmetry and mirror symmetry. The chiral piece may be used with either face upward. The pieces are vertex-connected.

Group 1 – vertex-connected

Group 2 – vertex to edge

Group 3 – edge-connected

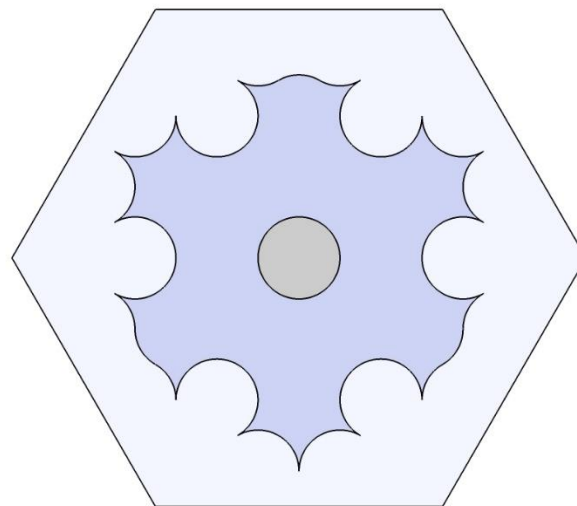

For the second group (Puzzles 9 through 12), 12 of the 13 pieces are chiral (4 of which have rotational symmetry) while the 13th piece has both rotational and mirror symmetry. The templates are chiral with three-fold rotational symmetry. The chiral pieces may be used with only one face upward, the face consistent with the chirality of the template. The chiral pieces can have two different shapes. The pieces are connected vertex-to-edge.

The third type (Puzzle 13), created by Jacques Griffioen and developed by Kate Jones, has 12 of the 13 pieces with mirror symmetry (5 of them also have rotational symmetry). The 13th piece is chiral and may be used with either face upward. The template has three-fold rotational symmetry and is chiral. The pieces are edge-connected.

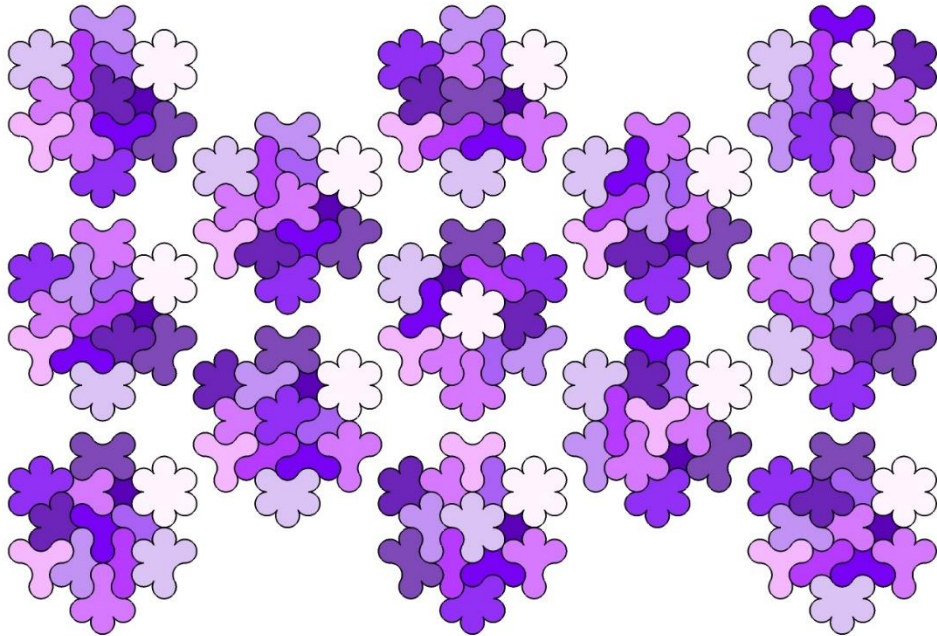

#### NOTES

- *Combinatorial Puzzle 1* – Twelve of its thirteen puzzle pieces appeared in the “Beat the Computer” Pia-Puzzle No. 0 published by Tenyo, Japan, in the 1960s-1970s. The “Beat the Computer” puzzle used a different template design and duplicated one of the puzzle pieces to obtain a thirteenth puzzle piece.
- *Combinatorial Puzzle 5* – Some of its complete geometric set of pieces are used in the STAR HEX™ puzzle published by Kadon Enterprises, Inc. The STAR HEX™ puzzle uses more pieces than Combinatorial Puzzle 5 and has different objectives.
- *Combinatorial Puzzle 7* – Some of this complete geometric set of pieces are used in the HEXNUT™ puzzles published by Kadon Enterprises, Inc. The HEXNUT™ puzzles use more pieces than Combinatorial Puzzle 7 and have different objectives.

# Combinatorial Puzzle 3

# Combinatorial Puzzle 4

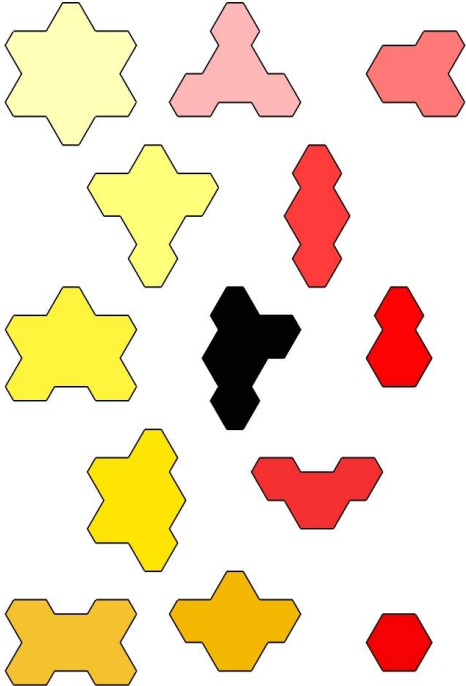

# Combinatorial Puzzle 5

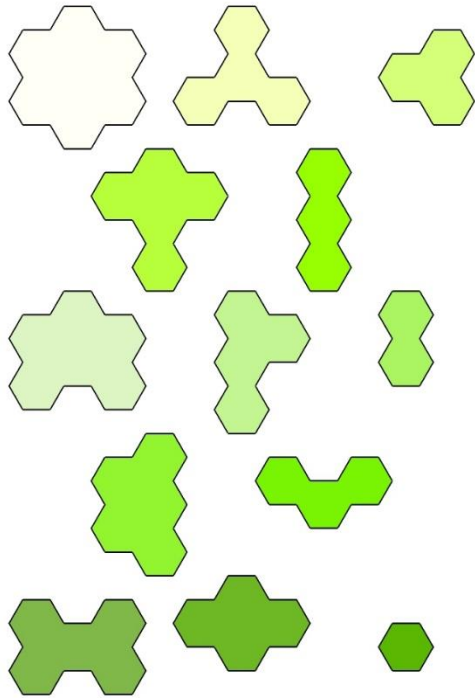

# Combinatorial Puzzle 6

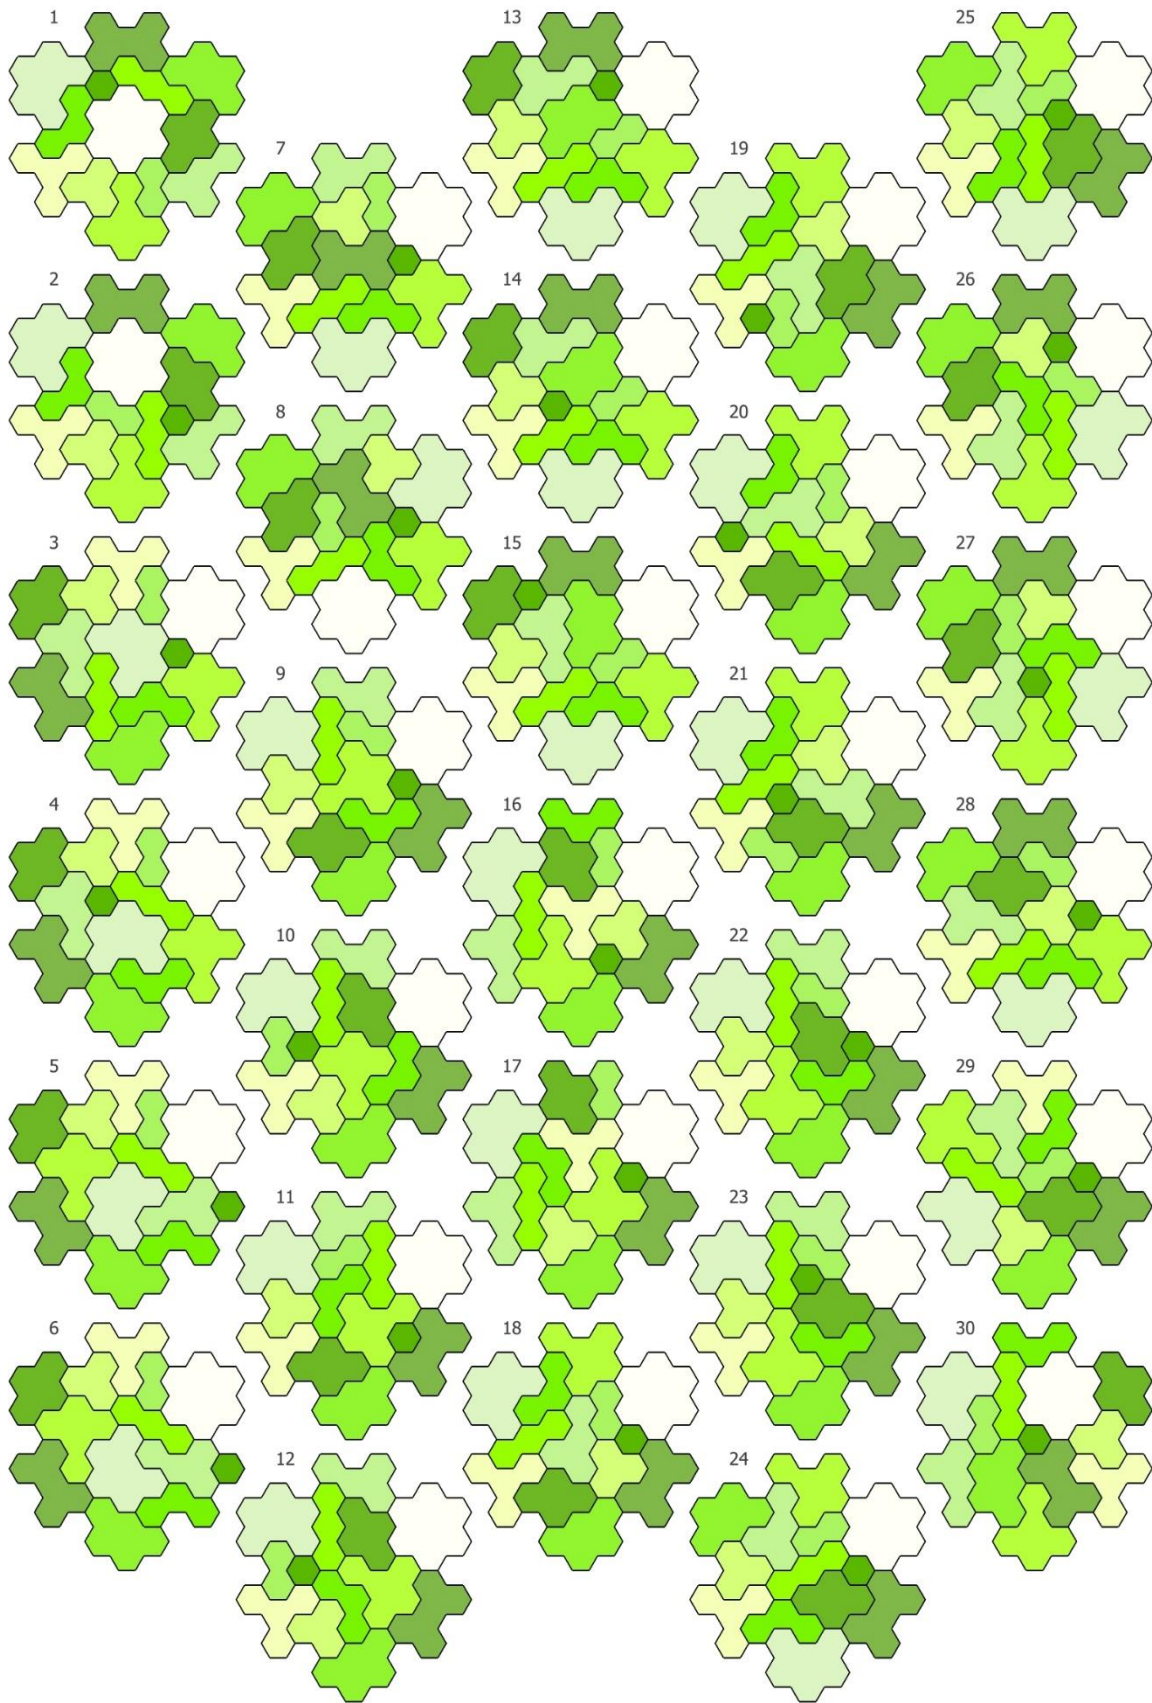

# Combinatorial Puzzle 7

## Combinatorial Puzzle 8

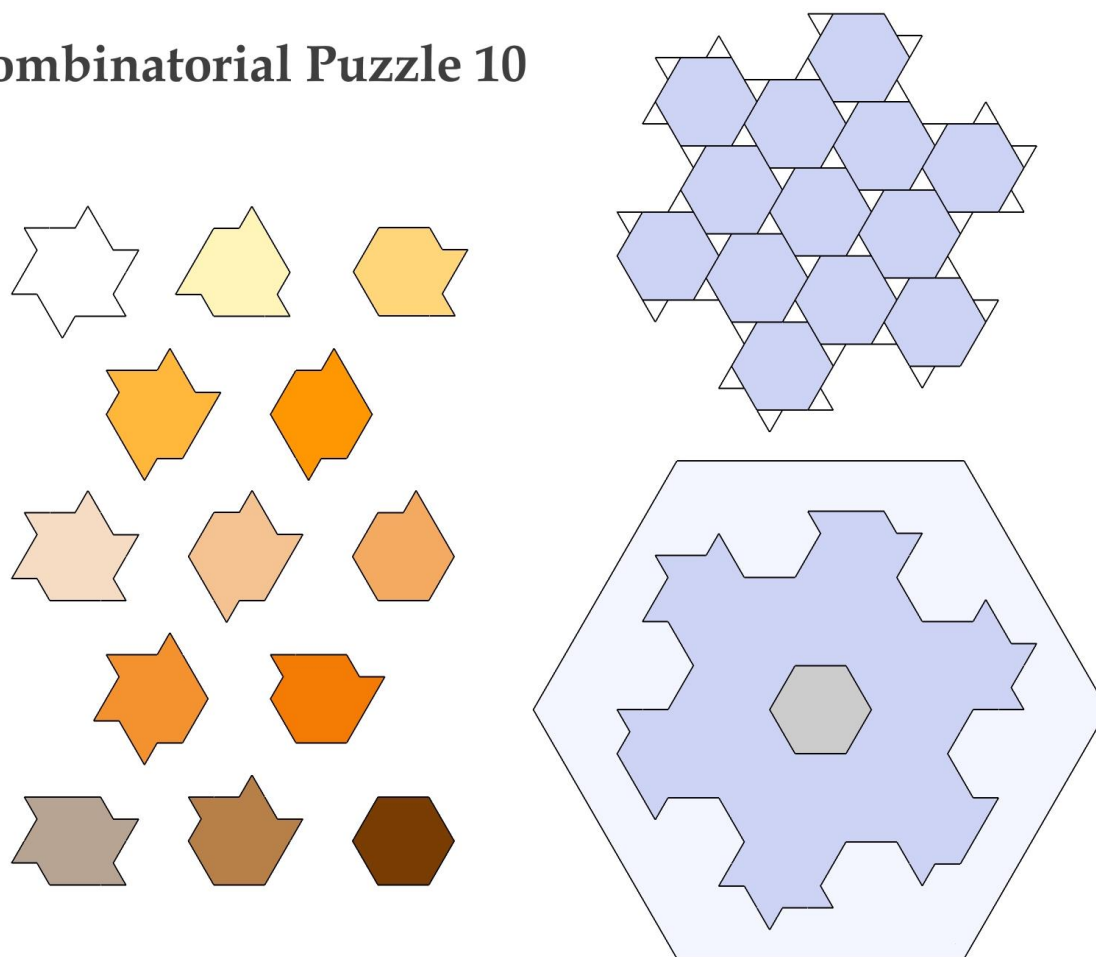

This puzzle differs from the previous versions inasmuch as the central shape and the surrounding shapes are congruent hexagons. An alternate objective for this puzzle is to find 30 solutions where every solution has a different hexagon at the center. See illustration above showing equivalent hexagons in the pieces.

"LEAVES" is a trademark of Kadon Enterprises, Inc.

There are many alternate possibilities for the design of the LEAVES pieces and templates. Some samples of design grids by Michael Dowle are illustrated below.

# LUCKY 13

*by Kate Jones – presented at G4G13*

What is 13? A famous digit,  
A prime, a luck sign, that makes people fidget.

Today I bring you, to win your smiles,  
13 sets of pretty tiles.  
Such geometry and tessellations  
Make for sweet math recreations.

These are the brainchild of Michael Dowle,  
A British scientist always on the prowl  
For designing puzzles with many solutions,  
Each with its 13 convolutions.

Behold how 13 different tiles make sport  
When ins and outs a hexagon distort.  
In their assembled star arrays  
Each tile in turn the center spot displays.

Observe now how some tiles are chiral.  
That's an idea that could go viral.  
And some have rotation on their mind  
While others reflect the mirror kind.

Now this one is a little strange--  
It wants each part of every tile to change.  
Not 13 but 30 different centers chase  
Solutions where each finds its place.

This non-symmetric center tile  
When flipped will go an extra mile  
And double up its tribal tricks  
As chiral spirals merge and mix.

It's wondrous how one stubborn piece  
Will drag the rest along like queens and bees.  
Your solving these takes twice the labor  
As every shape must please each neighbor.

This last one, "Leaves", is our own production  
From Jacques Griffioen's first introduction.

Its edge-wise connections and symmetry cycles  
Differ in style and template from Michael's.  
While only 7 can hold the center  
Map-coloring patterns also enter.

And here at G4G this year  
I present the world premiere  
Of one of Michael's lucky stars.  
We hereby launch the "Cookie Jars".

Besides the star, one hundred tasty treasures  
Await your pondering and solving pleasures.  
It's your lucky day such play to enable —  
Come see them at my sales room table!

# Cookie Jar™
